

WARMER. MORE NATURAL.

Introducing our improved LED Light Kit.

Solatube's award-winning Integrated LED Light Kit

Solatube's award-winning Integrated LED Light Kit allows the integration of natural light and traditional electric light from a single fixture for a cleaner ceiling appearance and nighttime illumination. It works by harnessing the sun's natural light during the day and additionally offers cost- and energy-efficient LED lighting at night. Our high-efficiency LED lighting system includes a dimming option that can be paired with manual and automated dimming controls, which is perfect for offices and schools where lighting control is important.

In line with our ongoing dedication to providing innovative and high-quality products, we are excited to announce these additions to our existing Integrated LED Light Kit. Available for Brighten Up 290 DS and SolaMaster 300, 330 and 750 DS.

A higher Color Rendering Index (CRI) of 90 enhances color accuracy and vividness, crucial for environments where precise color perception matters. From manufacturing floors, design rooms, to hospital settings and classrooms, improved color quality promotes greater work accuracy and reduces errors.

Solatube will be offering additional Kelvin temperature options to meet our customers' preferences. In addition to the existing 4000 Kelvin temperature option, we will be offering 3000 and 3500 Kelvin temperature options, which create a warmer lighting effect. Lower Kelvin temperatures are often preferred for creating a warm and comfortable atmosphere, making them ideal for settings like hotels and restaurants.
